

ABSTRACT OF THE DISCLOSURE

The present invention provides an ultraviolet-curable composition having satisfactory protective performance even
5 in endurance testing at high temperature and high humidity in an optical recording medium having for its reflective film Ag or a metal and/or alloy having Ag for its main component, and an optical recording medium in which it is applied. A cured film of an ultraviolet-curable
10 composition, for which the pH value of a 1 wt% methanol solution of said ultraviolet-curable composition is within the range of 4.5 to 6.8, is coated onto a reflective film in the form of a protective film.
